## South Carolina Adult Guidelines for Diabetes Care – 2017

Key concepts: goals should be individualized; certain populations (children, pregnant women, and elderly) require special considerations; less intensive glycemic goals may be indicated in patients with severe or frequent hypoglycemia; more intensive glycemic goals may further reduce microvascular complications at the cost of increasing hypoglycemia; postprandial glucose may be targeted if A1C goals are not met despite reaching preprandial glucose goals.

### Screening for Diagnosis of Diabetes

At age 45, all adults should be screened regardless of weight.

To test for diabetes or to assess risk of future diabetes, either A1C, Fasting Plasma Glucose (FPG), or 2-h 75 g Oral Glucose Tolerance Test (OGTT) are appropriate. An A1C level of 5.7% to 6.4% indicates increased risk for diabetes. The presence of diabetes is indicated by: A1C diabetes. The increased risk for ASCVD is indicated by: A1C diabetes. The increased risk for ASCVD is indicated by: A1C diabetes. The increased risk for ASCVD is indicated by: A1C diabetes. The increased risk for ASCVD is indicated by: A1C diabetes.

### Prevention/delay of type 2 diabetes: refer to support program
targeting weight loss of 7% of body weight and physical activity to at least 150 min/week (i.e. National Diabetes Prevention Program).

In those identified with prediabetes, identify and if appropriate, treat other CVD risk factors.

* Reference: International Diabetes Federation (IDF) Consensus Worldwide Deﬁnition of the Metabolic Syndrome

<table>
<thead>
<tr>
<th>Exam/Test</th>
<th>Care of the Person with Type 1 Diabetes</th>
<th>Care of the Person with Type 2 Diabetes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Complete exam</td>
<td>To classify the patient, detect complications, develop a management plan, and provide a basis for continuing care.</td>
<td>Quarterly, but dictated by severity of condition and response to treatment; if uncontrolled, visits may be more often. Inform the relatives of patients with type 1 diabetes of the opportunity to be tested for type 1 diabetes risk, but only in the setting of a clinical research study.</td>
</tr>
<tr>
<td>Office visits</td>
<td></td>
<td>Quarterly. Diet, physical activity, and behavioral therapy to achieve &gt;5% weight loss should be prescribed for overweight (BMI &gt; 20-30) and obese (BMI &gt; 30) patients with type 2 DM ready to achieve weight loss. FDA approved weight loss medications are available to be used as adjuncts in patients with BMI &gt; 27 kg/m2 with one or more obesity associated comorbid conditions and in patients with BMI &gt; 30 kg/m2 without comorbidities who are motivated to lose weight. Metabolic surgery should be recommended to treat type 2 DM in appropriate surgical candidates with BMI &gt; 40 kg/m2 (BMI &gt; 35.7 kg/m2 in Asian Americans), regardless of the level of glycemic control or complexity of glucose-lowering regimens, and in adults with BMI 35.0–39.9 kg/m2 (32.5–37.4 kg/m2 in Asian Americans) when hyperglycemia is inadequately controlled despite lifestyle and optimal medical therapy.*</td>
</tr>
<tr>
<td>Body Mass Index (Weight each visit; Height 1x/year)</td>
<td></td>
<td>Each visit. All adults should be screened regardless of weight. To test for diabetes or to assess risk of future diabetes, either A1C, Fasting Plasma Glucose (FPG), or 2-h 75 g Oral Glucose Tolerance Test (OGTT) are appropriate. An A1C level of 5.7% to 6.4% indicates increased risk for diabetes.</td>
</tr>
<tr>
<td>A1C Goal: A1C &lt; 7.0%</td>
<td>Quarterly, then 2x/year if meeting goal; more stringent goals (&lt; 6.5%) may further reduce complications at the cost of increased risk of hypoglycemia and may be considered in individual patients. In older adult with hypoglycemia, goal may be 7.5-8% to avoid hypoglycemia episodes, if history of severe hypoglycemia, advanced complications or limited life expectancy. *</td>
<td></td>
</tr>
<tr>
<td>Blood pressure</td>
<td>Systolic &lt; 140 mmHg; Diastolic &lt; 90 mmHg</td>
<td>Each visit. Prescribe medications for BP &gt; 140/90 mmHg along with lifestyle change. Recommended treatment: ACE-I or ARB, thiazide - like diuretics, or dihydropyridine calcium channel blockers. If using combination therapy to achieve target, then examine risks vs. benefits of goal of &lt; 140/90 and monitor for side effects. With increased cardiovascular risk, the BP target should be &lt; 130/80 mmHg.</td>
</tr>
</tbody>
</table>

### Lipid profile

Screening at diabetes diagnosis, initial medical evaluation, and/or at age 40. Thereafter every 5 years if not on a statin or frequently if on a statin or indicated. ** In addition to lifestyle therapy. *** ASCVD risk factors include LDL >100 mg/dL, high blood pressure, smoking, overweight, and obesity, and family history of premature ASCVD.

** Age Risk Factors **

### Diabetic Kidney disease

Assess spot urine albumin creatinine ratio (UACR) and estimated glomerular filtration rate eGFR. In all patients with comorbid hypertension. If UACR < 30 mg/g Cr refer to nephrologist. ACE-I or ARB recommended for treatment of microalbuminuria when 2 of 3 tests are elevated within a 6-month period. Should begin after five years duration then annually At diagnosis and annually.

### Management of CKD with calculated eGFR

Yearly measurement of UACR, serum Cr, potassium; more frequent monitoring depending on the eGFR at the time.

### Aspirin therapy

75-162 mg/day

All patients with type 1 or type 2 (unless contraindicated) with increased CV risk for primary prevention, including most men and women > age 50 with at least one additional CVD risk factor. As secondary prevention for all with history of CVD. For patients with atherosclerotic cardiovascular disease and documented aspirin allergy, clopidogrel 75mg/d should be used.

### Dilated eye exam

By an ophthalmologist or experienced optometrist in diabetic retinopathy. Within 5 years after onset of diabetes, then annually; less frequent exams (every 2 years) may be considered when eye exam normal. At diagnosis of diabetes, then annually; less frequent exams (every 2 years) may be considered when eye exam normal.

### Foot examination

Visual inspection at each visit. Comprehensive exam annually should include inspection of the skin, neurological assessment (10-g monofilament testing with at least one other assessment: pinprick, temperature, vibration, ankle reflexes), and vascular assessment including pulses in the legs and feet, assessment of foot deformities (local lesions, interdigital calluses, maceration, nails) musculoskeletal (ROM, foot type, digits, bony prominences). Specialized therapeutic footwear is recommended for high-risk patients with diabetes including those with severe neuropathy, foot deformities, or history of amputation.

### Self-monitored blood glucose (SMBG)

Goals: Preprandial glucose 80-130 mg/dL, Peak post-prandial glucose < 180 mg/dL, Prior to driving < 90 mg/dL. Three or more times daily for patients using multiple insulin injections or insulin pump therapy, including before meals or snacks, and occasionally postprandial, at bedtime, and prior to exercise, if suspect low BG and critical tasks such as driving. CGM is useful to lower A1c in type 1 DM > 25 yrs. May be helpful to guide treatment/self-management for patients using less frequent insulin injections or non-insulin therapies.

### Key Concepts
- Goals should be individualized; certain populations (children, pregnant women, and elderly) require special considerations; less intensive glycemic goals may be indicated in patients with severe or frequent hypoglycemia; more intensive glycemic goals may further reduce microvascular complications at the cost of increasing hypoglycemia; postprandial glucose may be targeted if A1C goals are not met despite reaching preprandial glucose goals.

### Adopted
- *Physical activity recommendations*
- *Dietary approaches to Stop Hypertension Eating Plan (DASH)*
- *Screening for depression*
- *Screening for diabetes*

### Reference unless otherwise noted:

### Exam/Test | Care of the Person with Type 1 Diabetes | Care of the Person with Type 2 Diabetes
---|---|---
**Hypoglycemia** | The preferred treatment is glucose (15-20 grams) for a conscious individual; any glucose containing carbohydrate is appropriate. Repeat treatment if SMBG in fifteen shows persistent hypoglycemia. When SMBG returns to normal, the person should eat a meal or snack to prevent hypoglycemia recurrence. Prescribe glucagon 1 mg SC/IM for all individuals at significant risk of severe hypoglycemia. If patient drives, assess patient's medical history for loss of consciousness and ability to drive. |  
**Review self-management goals** | Each visit emphasizes glycemic and hypertensive control; weight loss recommended for all overweight or obese individuals at risk for or with diabetes using Mediterranean, low fat/calorie restricted or low-carbohydrate diet. At least 150 minutes per week of moderate-intensity aerobic physical activity*; if no contraindications, encourage people to perform 2 DM to perform resistance training ≥ 2 times/week; review eating patterns with emphasis on carbohydrate -key strategy in glycemic control, if hypertensive- encourage DASH** style dietary pattern including reducing sodium and increasing potassium intake, and saturated fats; (should be < 7% of total calories); minimize intake of trans fat; substitute monounsaturated for saturated and trans fat (AACE). Encourage dietary fiber of 14 gm of fiber/1,000 kcal and whole grain foods Limit daily alcohol to 1 drink or less for women and 2 drinks or less for men. For lipids, increase omega 3 fats; viscous fiber, and plant stanols/sterols; reduce saturated, trans fat and dietary cholesterol. |  
**Diabetes self-management education and support (DSMS)** | Education should be individualized, based on the National Standards for DSMS and include the AADE7™:  
- Being Active - regular physical and working towards an appropriate BMI.  
- Problem Solving - Assessment of patient knowledge, attitudes, self-management skills and health status; strategies for making health behavior changes and addressing psychosocial concerns.  
- Taking Medication - safe and effective use of medications; prevention, detection and treatment of acute and chronic complications, including recognition of hypoglycemia.  
- Healthy Eating - importance of nutrition management and healthy diet.  
- Monitoring - Role of self-monitoring of blood glucose in glycemic control.  
- Reducing Risks - Cardiovascular risk reduction, smoking cessation intervention and secondhand smoke avoidance, sexual dysfunction, self-care of feet, preconception counseling, dental care.  
- Healthy Coping – Set achievable behavioral goals and provide encouragement and coping strategies.  
Individuals with pre-diabetes or diabetes should receive individualized Medical Nutrition Therapy (MNT) by registered dietitian (RD).  
Type 1 DM patients should be educated how to match prandial insulin dose to carbohydrate intake, pre-meal blood glucose and anticipated activity. |  
**Assessment of patient's psychological & social situation** | Initial and ongoing part of medical management of diabetes. |  
**Mental health screen**:  
- Depression screen  
- Anxiety screen  
- Disordered eating behavior | All adults with a diagnosis of diabetes will be screened for depression using any screening method that the provider prefers *** or asking the following two questions:  
1. "Over the past 2 weeks have you felt down, depressed, or hopeless?"  
2. "Over the past 2 weeks have you felt little interest or pleasure in doing things?" (If positive for the 2 questions, screen further for depression.) Depression: Referrals for treatment of depression should be made to experienced mental health providers in conjunction with collaborative care with the patient’s diabetes treatment team. Anxiety: Consider screening in people exhibiting anxiety regarding diabetes complications, insulin injections or infusion, taking medications, and/or hypoglycemia that interferes with self-management behaviors. Disordered eating behavior: Consider reevaluating the treatment regimen if patient presents with symptoms of disordered eating behavior, an eating disorder, or disrupted patterns of eating. ***Zung, Beck, PHQ-9, CES-D |  
**Immunizations:**  
- Influenza  
- Pneumonia: 2 pneumococcal conjugate vaccines available (PCV13 and PPSV23)  
- Hepatitis B | Influenza: Annually for all patients > 2 years of age.  
Pneumonia: All people with diabetes, 2 through 64 years of age, with pneumococcal polysaccharide vaccine (PPSV23). At age > 65 years, administer (PCV13) at least 1 year after vaccination with PPSV23, followed by another dose of vaccine PPSV23 at least 1 year after PCV13, and at least 5 years after the last dose of PPSV23.  
Hepatitis B: Consider administering 3-dose series of hepatitis B vaccine to unvaccinated adults with diabetes who are age > 60 years. |  
**Smoking cessation** | Advise smoking/tobacco cessation counseling and other forms of treatment. Advise all patients not to smoke. Refer to SC Quit Line available at 1-800-QuitNow. E-cigarettes SHOULD NOT be used as an alternative to smoking. |  
**Others:**  
- Oral Health, Obstructive Sleep Apnea, Liver function tests | Consider Oral exam every 6 months, screening for OSA in symptomatic patients. LFTs annually |  
- Preconception and family planning counseling | Preconception counseling for all women of childbearing age. Women with gestational diabetes should be screened for diabetes 6 to 12 weeks postpartum and should have subsequent screening for the development of diabetes or prediabetes at least every 3 years. |  
- Autoimmune disease screening | Screen for thyroid disease (TSH). Celiac disease, Pernicious Anemia in persons with type 1 soon after diagnosis and as appropriate. TSH can be rechecked every 1-2 years or with symptoms of thyroid dysfunction. Free T4 should be measured if TSH abnormal. |
