**Prediction of Stroke Recovery Outcomes**

*Wuwei (Wayne) Feng MD. (Vascular Neurology Clinical Fellow, Department of Neurology, BIDMC/Harvard Medical School)*

Predicting motor outcome in the acute stroke phase is critical for clinicians to appropriately triage patients for different rehabilitation options and for the patient and the patient’s caregivers to establish realistic goals of recovery potential. Researchers have gained some understanding of motor outcome, however, significant inter-individual variability exists and a notable amount of variance in outcome regression models remains unknown. The talk will review current predictor for motor outcome, including demographic measures, behavioral measures, imaging measures and genetic measures.
